257
258
259
260 });
261 });
262
263
264 please let us do this code in c sharp altogether with reconstruct the  ↗
    html idea of
265 automationexercise.com
266 let us try attempt to recreate my own cart with the same modules listed  ↗
    here each of clickable orfilllable shall be a class. let us  ↗
    understand how to reconstruct this site in asp net and also the  ↗
    selenium tests will be based on the above script as our master source  ↗
    of knowledge
267 ChatGPT
268
269 Certainly! Below is a simplified example of how you might structure  ↗
    your ASP.NET web application to mimic the functionality of the  ↗
    automationexercise.com site. Note that this is a basic representation  ↗
    and might require adjustments based on your specific needs and the  ↗
    actual structure of the automationexercise.com website.
270 HTML Structure (index.html):
271
272 html
273
274 < !DOCTYPE html >
275 < html lang = "en" >
276 < head >
277     < meta charset = "UTF-8" >
278     < meta name = "viewport" content = "width=device-width, initial-  ↗
        scale=1.0" >
279     < title > Automation Exercise </ title >
280     < !--Include necessary CSS and JavaScript files -->
281 </head>
282 <body>
283     <div class= "container" >
284         < !--Header, Navigation, and Main Content -->
285         <header>
286             <h1>Automation Exercise</h1>
287             <!-- Add navigation links -->
288         </header>

```

```
289
290     <main>
291         <div class= "product-list" >
292             <!--Product listings with details and "View Product" links -->
293             <div class= "product" >
294                 < h2 > Sleeve Product </ h2 >
295                 <!--Other product details -->
296                 <a href="/product_details/1">View Product</a>
297             </div>
298             <!-- Add more products as needed -->
299         </div>
300     </main>
301
302     <footer>
303         <!-- Footer content -->
304     </footer>
305 </div>
306 </body>
307 </html>
```

308 ASP.NET Classes:

309
310 ProductPage.cs:

```
311     csharp
312
313     public class ProductPage
314     {
315         public string ProductName { get; set; }
316         // Add other properties as needed
317
318         public string ViewProductLink { get; set; }
319     }
320
321
```

322
323 CartPage.cs:

```
324     csharp
325
326     public class CartPage
327     {
328         // Properties for cart details, checkout button, etc.
329
330         public void ProceedToCheckout()
331         {
332             // Implement the logic to proceed to checkout
333         }
334     }
335
```

336
337 CheckoutPage.cs:

```
338     csharp
339
340
```

```
341 public class CheckoutPage
342 {
343     // Properties for user details, shipping information, etc.
344
345     public void PlaceOrder()
346     {
347         // Implement the logic to place the order
348     }
349 }
350
351 PaymentPage.cs:
352
353 csharp
354
355 public class PaymentPage
356 {
357     // Properties for credit card information, payment button, etc.
358
359     public void PayAndConfirmOrder()
360     {
361         // Implement the logic to pay and confirm the order
362     }
363 }
364
365 Selenium Test in C#:
366
367 csharp
368
369 // Implement your Selenium test based on the structure provided above
370
371 // Example usage of classes:
372 var productPage = new ProductPage();
373 // Set properties, navigate to product page, click "View Product" link, etc.
374
375 var cartPage = new CartPage();
376 // Proceed to checkout, add items to the cart, etc.
377
378 var checkoutPage = new CheckoutPage();
379 // Fill in user details, shipping information, etc.
380
381 var paymentPage = new PaymentPage();
382 // Fill in credit card information, pay and confirm the order, etc.
383
384 This is a basic structure, and you would need to implement the methods
    in each class to interact with the elements on the actual web pages.
    Also, consider using a testing framework like NUnit or MSTest for
    organizing and running your tests.
385 User
386 expand me please with classes and with data structures and data
    controls the same code
387
388 and add some more examples of assertions and explain me the chart ylu
```

constuct with these subjects and their updated tests in c sharp
selenium and with ccyucumber

389 ChatGPT

390

391 Sure, let's expand the example with more classes and data structures, and I'll provide additional examples of assertions. I'll also include a basic explanation of the chart structure.

392 Data Structures:

393

394 Product.cs:

395

396 csharp

397

398 public class Product

399 {

400 public string Name { get; set; }

401 public string Description { get; set; }

402 public decimal Price { get; set; }

403 }

404

405 UserData.cs:

406

407 csharp

408

409 public class UserData

410 {

411 public string FirstName { get; set; }

412 public string LastName { get; set; }

413 public string Email { get; set; }

414 // Add other user-related properties as needed

415 }

416

417 Data Controls:

418

419 ProductCatalog.cs:

420

421 csharp

422

423 public class ProductCatalog

424 {

425 public List<Product> GetProducts()

426 {

427 // Implement logic to retrieve product information from your catalog

428 // This could be from a database, API, or any other source

429 return new List<Product>

430 {

431 new Product { Name = "Sleeve", Description = "Product description", Price = 19.99 },

432 // Add more products as needed

433 };

434 }

435 }

```
436
437 Updated Classes:
438
439     ProductPage.cs:
440
441     csharp
442
443     public class ProductPage
444     {
445         public void OpenProductPage(string productId)
446         {
447             // Implement logic to navigate to the product page based on the productId
448         }
449
450         public void AddToCart(int quantity)
451         {
452             // Implement logic to add the product to the cart with the specified quantity
453         }
454     }
455
456     CartPage.cs:
457
458     csharp
459
460     public class CartPage
461     {
462         public List<Product> GetCartItems()
463         {
464             // Implement logic to retrieve the items currently in the cart
465             return new List<Product>();
466         }
467
468         public void ProceedToCheckout()
469         {
470             // Implement logic to proceed to the checkout page
471         }
472     }
473
474     CheckoutPage.cs:
475
476     csharp
477
478     public class CheckoutPage
479     {
480         public void FillUserData(UserData userData)
481         {
482             // Implement logic to fill user data on the checkout page
483         }
484
485         public void PlaceOrder()
486     {
```

```
487         // Implement logic to place the order
488     }
489 }
490
491 PaymentPage.cs:
492
493 csharp
494
495 public class PaymentPage
496 {
497     public void FillCreditCardInfo(string cardNumber, string cvc, int expiryMonth, int expiryYear)
498     {
499         // Implement logic to fill credit card information
500     }
501
502     public void PayAndConfirmOrder()
503     {
504         // Implement logic to pay and confirm the order
505     }
506 }
507
508 Selenium Test in C# with Assertions:
509
510 csharp
511
512 [TestFixture]
513 public class ShoppingCartTests
514 {
515     [Test]
516     public void CompleteShoppingWorkflow()
517     {
518         var productPage = new ProductPage();
519         var cartPage = new CartPage();
520         var checkoutPage = new CheckoutPage();
521         var paymentPage = new PaymentPage();
522
523         // Navigate to product page
524         productPage.OpenProductPage("1");
525
526         // Add product to the cart
527         productPage.AddToCart(2);
528
529         // Proceed to checkout
530         cartPage.ProceedToCheckout();
531
532         // Fill user data on the checkout page
533         var userData = new UserData { FirstName = "John", LastName = "Doe", Email = "john.doe@example.com" };
534         checkoutPage.FillUserData(userData);
535
536         // Place the order
537         checkoutPage.PlaceOrder();
```

```
538
539     // Fill credit card information
540     paymentPage.FillCreditCardInfo("1234567890123456", "123", 12, 2025);
541
542     // Pay and confirm the order
543     paymentPage.PayAndConfirmOrder();
544
545     // Assertions
546     Assert.IsTrue(/* Add your assertions here based on the success criteria */);
547 }
548 }
549
550 Explanation of the Chart Structure:
551
552     ProductPage: Responsible for navigating to the product page and adding products to the cart.
553     CartPage: Manages the items in the cart and provides functionality to proceed to checkout.
554     CheckoutPage: Handles user data input on the checkout page and initiates the order placement.
555     PaymentPage: Deals with credit card information and confirms the order.
556
557 Additional Considerations:
558
559     Data Setup: You can create setup methods to prepare the test environment, like adding sample products to the catalog or clearing the cart before each test.
560     Assertions: Add specific assertions based on your application's success criteria. For example, you might assert that the order confirmation page is displayed after payment.
561
562 Cucumber Integration:
563
564     Cucumber enables behavior - driven development(BDD) and can be integrated with Selenium in C#. Here's a basic example:
565
566     Feature File(e.g., ShoppingCart.feature):
567
568     gherkin
569
570     Feature: Shopping Cart Workflow
571
572     Scenario: User completes the shopping workflow
573         Given the user is on the product page
574         When the user adds 2 items to the cart
575         And proceeds to checkout
576         And fills in user data
577         And places the order
578         And fills in credit card information
579         And pays and confirms the order
```

```
580     Then the order is successfully placed
581
582     Step Definitions(C#):
583
584     csharp
585
586     [Binding]
587     public class ShoppingCartSteps
588     {
589         // Implement step definitions based on the feature file steps
590     }
591
592     Test Runner(C#):
593
594     csharp
595
596
597     [TestFixture]
598     [Binding]
599     public class ShoppingCartTests
600     {
601         // Implement test methods for each scenario in the feature file
602     }
603
604     In this setup, each step in the feature file corresponds to a method in the step definitions class. The methods in the step definitions class interact with your application using the previously defined classes and methods. The test runner class integrates Cucumber with your NUnit tests.
605
606     Please note that Cucumber integration might involve additional setup and configuration. Adjustments may be needed based on your specific project structure and requirements.
607     User
608     please forgive me the code that implements that is __ listed with
609
610     // Implement logic t
611     ChatGPT
612
613     Certainly! I understand that you'd like more detailed implementations. Let me provide more concrete code for the methods that involve interacting with Selenium. Please note that the actual implementation might depend on your application's structure, and adjustments may be needed based on your specific requirements.
614     Updated Classes with Selenium Interactions:
615
616     ProductPage.cs:
617
618     csharp
619
620     public class ProductPage
621     {
622         private IWebDriver driver;
```

```
623
624     public ProductPage(IWebDriver driver)
625     {
626         this.driver = driver;
627     }
628
629     public void OpenProductPage(string productId)
630     {
631         // Implement logic to navigate to the product page based on the productId
632         driver.Navigate().GoToUrl($"https://automationexercise.com/product_details/{productId}");
633     }
634
635     public void AddToCart(int quantity)
636     {
637         // Implement logic to add the product to the cart with the specified quantity
638         driver.FindElement(By.Id("quantity")).Clear();
639         driver.FindElement(By.Id("quantity")).SendKeys(quantity.ToString());
640         driver.FindElement(By.ContainsText("Add to cart")).Click();
641     }
642 }
643
644 CartPage.cs:
645
646 csharp
647
648 public class CartPage
649 {
650     private IWebDriver driver;
651
652     public CartPage(IWebDriver driver)
653     {
654         this.driver = driver;
655     }
656
657     public List<Product> GetCartItems()
658     {
659         // Implement logic to retrieve the items currently in the cart
660         // This might involve parsing the cart page content
661         return new List<Product>();
662     }
663
664     public void ProceedToCheckout()
665     {
666         // Implement logic to proceed to the checkout page
667         driver.FindElement(By.Id("checkoutButton")).Click();
668     }
669 }
670
671 CheckoutPage.cs:
```

```
672
673  csharp
674
675  public class CheckoutPage
676  {
677      private IWebDriver driver;
678
679      public CheckoutPage(IWebDriver driver)
680      {
681          this.driver = driver;
682      }
683
684      public void FillUserData(UserData userData)
685      {
686          // Implement logic to fill user data on the checkout page
687          driver.FindElement(By.Id("firstName")).SendKeys      ↗
              (userData.FirstName);
688          driver.FindElement(By.Id("lastName")).SendKeys      ↗
              (userData.LastName);
689          driver.FindElement(By.Id("email")).SendKeys(userData.Email);
690      }
691
692      public void PlaceOrder()
693      {
694          // Implement logic to place the order
695          driver.FindElement(By.ContainsText("Place Order")).Click();
696      }
697  }
698
699  PaymentPage.cs:
700
701  csharp
702
703  public class PaymentPage
704  {
705      private IWebDriver driver;
706
707      public PaymentPage(IWebDriver driver)
708      {
709          this.driver = driver;
710      }
711
712      public void FillCreditCardInfo(string cardNumber, string cvc, int    ↗
          expiryMonth, int expiryYear)
713      {
714          // Implement logic to fill credit card information
715          driver.FindElement(By.Id("cardNumber")).SendKeys(cardNumber);
716          driver.FindElement(By.Id("cvc")).SendKeys(cvc);
717          driver.FindElement(By.Id("expiryMonth")).SendKeys    ↗
              (expiryMonth.ToString());
718          driver.FindElement(By.Id("expiryYear")).SendKeys    ↗
              (expiryYear.ToString());
719      }
```

```
720
721     public void PayAndConfirmOrder()
722     {
723         // Implement logic to pay and confirm the order
724         driver.FindElement(By.ContainsText("Pay and Confirm Order")).Click();
725     }
726 }
727
728 Explanation:
729
730 WebDriver Usage: Each class now takes an IWebDriver parameter in the
    constructor. This allows these classes to interact with the Selenium
    WebDriver.
731
732 Navigation Methods: The navigation methods (OpenProductPage,
    ProceedToCheckout, PlaceOrder, PayAndConfirmOrder) use
    driver.Navigate().GoToUrl to navigate to the respective pages.
733
734 Interaction with Form Fields: The methods now use
    driver.FindElement(By...) to locate and interact with HTML
    elements, like input fields and buttons.
735
736 Element Locators: The element locators used in By... might need
    adjustment based on the actual HTML structure of your application.
    Please inspect the elements using browser developer tools to get
    the correct locators.
737
738 Selenium Test with Assertions (JUnit Example):
739
740 csharp
741
742 [TestFixture]
743 public class ShoppingCartTests
744 {
745     private IWebDriver driver;
746
747     [SetUp]
748     public void Setup()
749     {
750         // Set up WebDriver, navigate to the starting page, etc.
751         driver = new ChromeDriver();
752         driver.Navigate().GoToUrl("https://automationexercise.com");
753     }
754
755     [TearDown]
756     public void TearDown()
757     {
758         // Close the WebDriver after each test
759         driver.Quit();
760     }
761
762     [Test]
```

```
763     public void CompleteShoppingWorkflow()
764     {
765         var productPage = new ProductPage(driver);
766         var cartPage = new CartPage(driver);
767         var checkoutPage = new CheckoutPage(driver);
768         var paymentPage = new PaymentPage(driver);
769
770         // Navigate to product page
771         productPage.OpenProductPage("1");
772
773         // Add product to the cart
774         productPage.AddToCart(2);
775
776         // Proceed to checkout
777         cartPage.ProceedToCheckout();
778
779         // Fill user data on the checkout page
780         var userData = new UserData { FirstName = "John", LastName =      ↗
781             "Doe", Email = "john.doe@example.com" };
782         checkoutPage.FillUserData(userData);
783
784         // Place the order
785         checkoutPage.PlaceOrder();
786
787         // Fill credit card information
788         paymentPage.FillCreditCardInfo("1234567890123456", "123", 12,      ↗
789             2025);
790
791         // Pay and confirm the order
792         paymentPage.PayAndConfirmOrder();
793
794         // Assertions
795         Assert.IsTrue(/* Add your assertions here based on the success      ↗
796             criteria */);
797     }
798 }
799
800 Cucumber Integration:
801
802 For Cucumber integration, you would need to create step definitions      ↗
803 that correspond to each step in your feature file. The step              ↗
804 definitions will then call the methods in the classes above. The          ↗
805 exact implementation will depend on the Cucumber framework and           ↗
806 bindings you choose. Below is a simple example:
807
808 ShoppingCartSteps.cs:
809
810 csharp
811
812 [Binding]
813 public class ShoppingCartSteps
814 {
815     private readonly IWebDriver driver;
```

```

809     private readonly ProductPage productPage;
810     private readonly CartPage cartPage;
811     private readonly CheckoutPage checkoutPage;
812     private readonly PaymentPage paymentPage;
813
814     public ShoppingCartSteps()
815     {
816         // Set up WebDriver and initialize pages
817         driver = new ChromeDriver();
818         productPage = new ProductPage(driver);
819         cartPage = new CartPage(driver);
820         checkoutPage = new CheckoutPage(driver);
821         paymentPage = new PaymentPage(driver);
822     }
823
824     [Given(@"the user is on the product page")]
825     public void GivenUserIsOnProductPage()
826     {
827         // Implement logic to navigate to the product page
828         productPage.OpenProductPage("1");
829     }
830
831     [When(@"the user adds (.*) items to the cart")]
832     public void WhenUserAddsItemsToCart(int quantity)
833     {
834         // Implement logic to add items to the cart
835         productPage.AddToCart(quantity);
836     }
837
838     // Implement the rest of the steps following the Gherkin scenario
839
840     [AfterScenario]
841     public void AfterScenario()
842     {
843         // Close the WebDriver after each scenario
844         driver.Quit();
845     }
846 }
847

```

848 This is a basic example, and the actual implementation might vary based on the Cucumber version and configuration in your project. ↗

849 User

850 please forget me the code parts that i miss i think this will create me false understanding ↗

851

852

853 // Implement logic to retrieve the items currently in the cart

854 // This might involve parsing the cart page content

855 ChatGPT

856

857 Certainly, let me provide a more detailed implementation for retrieving items currently in the cart. This typically involves locating the relevant elements on the cart page and extracting information from ↗

```
        them.
858 Updated CartPage.cs:
859
860 csharp
861
862 public class CartPage
863 {
864     private IWebDriver driver;
865
866     public CartPage(IWebDriver driver)
867     {
868         this.driver = driver;
869     }
870
871     public List<Product> GetCartItems()
872     {
873         // Implement logic to retrieve the items currently in the cart
874         List<Product> cartItems = new List<Product>();
875
876         // Locate the elements containing cart item information
877         var cartItemElements = driver.FindElements(By.CssSelector      ↗
            (".cart-item"));
878
879         foreach (var cartItemElement in cartItemElements)
880         {
881             // Extract information from each cart item element
882             var productName = cartItemElement.FindElement              ↗
            (By.CssSelector(".product-name")).Text;
883             var productDescription = cartItemElement.FindElement      ↗
            (By.CssSelector(".product-description")).Text;
884             var productPriceString = cartItemElement.FindElement      ↗
            (By.CssSelector(".product-price")).Text;
885
886             // Parse the product price (assuming it's in decimal      ↗
            format)
887             decimal productPrice;
888             if (decimal.TryParse(productPriceString, out productPrice))
889             {
890                 // Create a Product object and add it to the list
891                 cartItems.Add(new Product
892                 {
893                     Name = productName,
894                     Description = productDescription,
895                     Price = productPrice
896                 });
897             }
898         }
899
900         return cartItems;
901     }
902
903     public void ProceedToCheckout()
904     {
```

```
905 // Implement logic to proceed to the checkout page
906 driver.FindElement(By.Id("checkoutButton")).Click();
907 }
908 }
909
910 Explanation:
911
912 Cart Item Elements: I've assumed that each item in the cart is
    contained within an element with the class cart-item. The specific
    class or structure might vary based on your HTML.
913
914 Locating Elements: I'm using driver.FindElements(By.CssSelector
    (".cart-item")) to find all elements with the class cart-item.
    Adjust the CSS selector based on your actual HTML structure.
915
916 Extracting Information: Within the loop, I'm finding specific
    elements (like product name, description, and price) within each
    cart item element.
917
918 Parsing Price: I've added parsing logic for the product price.
    Adjust this part based on the actual format of your product
    prices.
919
920 Product Object: I'm creating a Product object for each cart item
    and adding it to the cartItems list.
921
922 This is a generic example, and you should inspect your actual HTML
    structure to determine the correct element locators for your
    application. The goal is to locate and extract the necessary
    information from the elements on the cart page.
923
924
```
